

Android ANT+

RPM² now utilizes ANT+ technology connecting Android devices to your head unit enabling you to see your cycling power. Garmin keeps a directory of all **Android** devices that are compatible with ANT+ here:

<https://www.thisisant.com/directory/filter/~/60/>

If your device wasn't in the above directory on thisisant.com then you'll need a few things before your device works with ANT+. First of these are two pieces of hardware:

- The ANT+ USB Stick: <https://www.thisisant.com/directory/usb-ant-stick>
- And a cable to connect it to your device: <http://amzn.com/B00LN3LQKQ>

Next you'll need two applications from the Google Play Store:

- ANT+ Radio Service: <https://play.google.com/store/apps/details?id=com.dsi.ant.service.socket&hl=en>
- ANT+ Plugins Service: <https://play.google.com/store/apps/details?id=com.dsi.ant.plugins.antplus&hl=en>

Initial Connection

- Open RPM² application
- Connect to Insoles
- Choose your Cycling event
- Start the Cycling event. You do not need to ride the bike, simply have your insoles nearby
- Have your head unit search for ANT+ devices, it will find one
- RPM² device Manufacturers Code is: 1337
- Select to pair with RPM²
- End your Cycling event

Your head unit should now automatically display power data the next time you use RPM².

Use after Initial Connection

- Start your head unit
- Open RPM² application
- Connect to insoles
- Choose your Cycling event
- Begin your Cycling event
- Head unit should pick up the ANT+ connection and automatically transmit and display your power data/cadence.
